One of my mentors in economics taught me early in my career that the three pillars of macroeconomic stability are price stability, financial stability, and fiscal sustainability. To illustrate the concept, he used the analogy of a tripod: if one of its legs fails (any of the three pillars), the entire structure collapses. A financial system cannot be stable without controlled inflation and sound fiscal dynamics. Likewise, a central bank cannot effectively control inflation if the financial system and markets are experiencing major disruptions or if public debt is unsustainable. All three conditions must be met simultaneously.
