Un Credit Default Swap (CDS) es un instrumento financiero por medio del cual se negocia el riesgo crediticio de un bono. El tenedor paga una prima (puntos básicos sobre el valor nominal del bono) a la entidad que ofrece el CDS a cambio de que esta responda por un valor nominal en caso que el emisor haga default. La valoración de un CDS se hace en puntos básicos sobre el valor nominal del bono y tiene una relación directa con el nivel de aversión al riesgo de los inversionistas. Es decir, entre mas alta sea la probabilidad de default, mayor será el valor del CDS y viceversa.

La tasa de interés doméstica equivalente es obtenida de la relación de equilibrio que debe existir entre la misma, la tasa de interés externa y la devaluación implícita en los contratos a futro de peso dólar para que no existan oportunidades de arbitraje. La fórmula para el cálculo es (1+ i) = (F/S) (1 + i*), en donde i es la tasa de interés doméstica, F es el promedio ponderado de los precios en los contratos a futuro para el plazo (forwards), S es el precio del dólar en el mercado de contado, e i* es la tasa de interés externa al plazo especificado (LIBOR).
